

King Solomon School Hakfar Hayarok

The design concept is based on the wish to translate the pedagogical - philosophical idea of the holistic education to an exciting learning experience

The star of David symbol was the formal inspiration for the design. The inner shape- created from the intersection of the two triangles- is a hexagon, a shape with universal values.

The school's holistic approach is about the connection of man to its community, to nature and to moral values. The hexagon shape is common in nature (bee hives) as well as in mathematics.

The tables in the classes are designed to create a fun and modular learning experience.

The kids dining room is also planned so the kids can seat in groups.

On the main wall there are imprinted motives of the seven species and of tableware combining natural wood and colors for keeping a warm and fun environment.

In the library- all the book stands are designed as bus stations so the kids can feel like they are traveling in imagination with every story they read.
