During my architectural way year by year I tried to acquire a broad knowledge base ranging across sciences and humanities

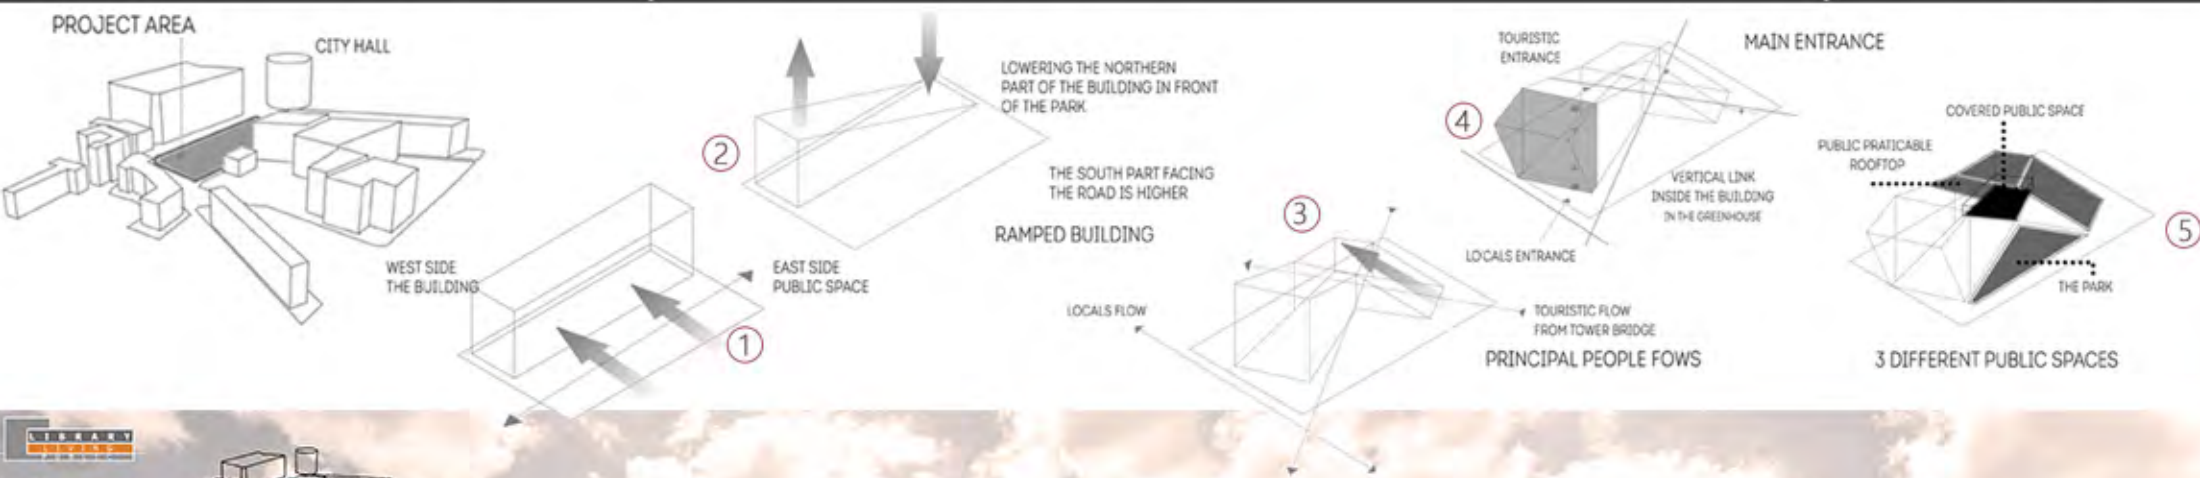

A Design research

In every project I face, my first aim is to integrate the architectural design work with the wider landscape context. Furthermore the historical role of buildings has to be considered as well, because architecture is about art!

In college I learned the importance of engineering and technological discipline, so I'm glad to attend a politechnic school.

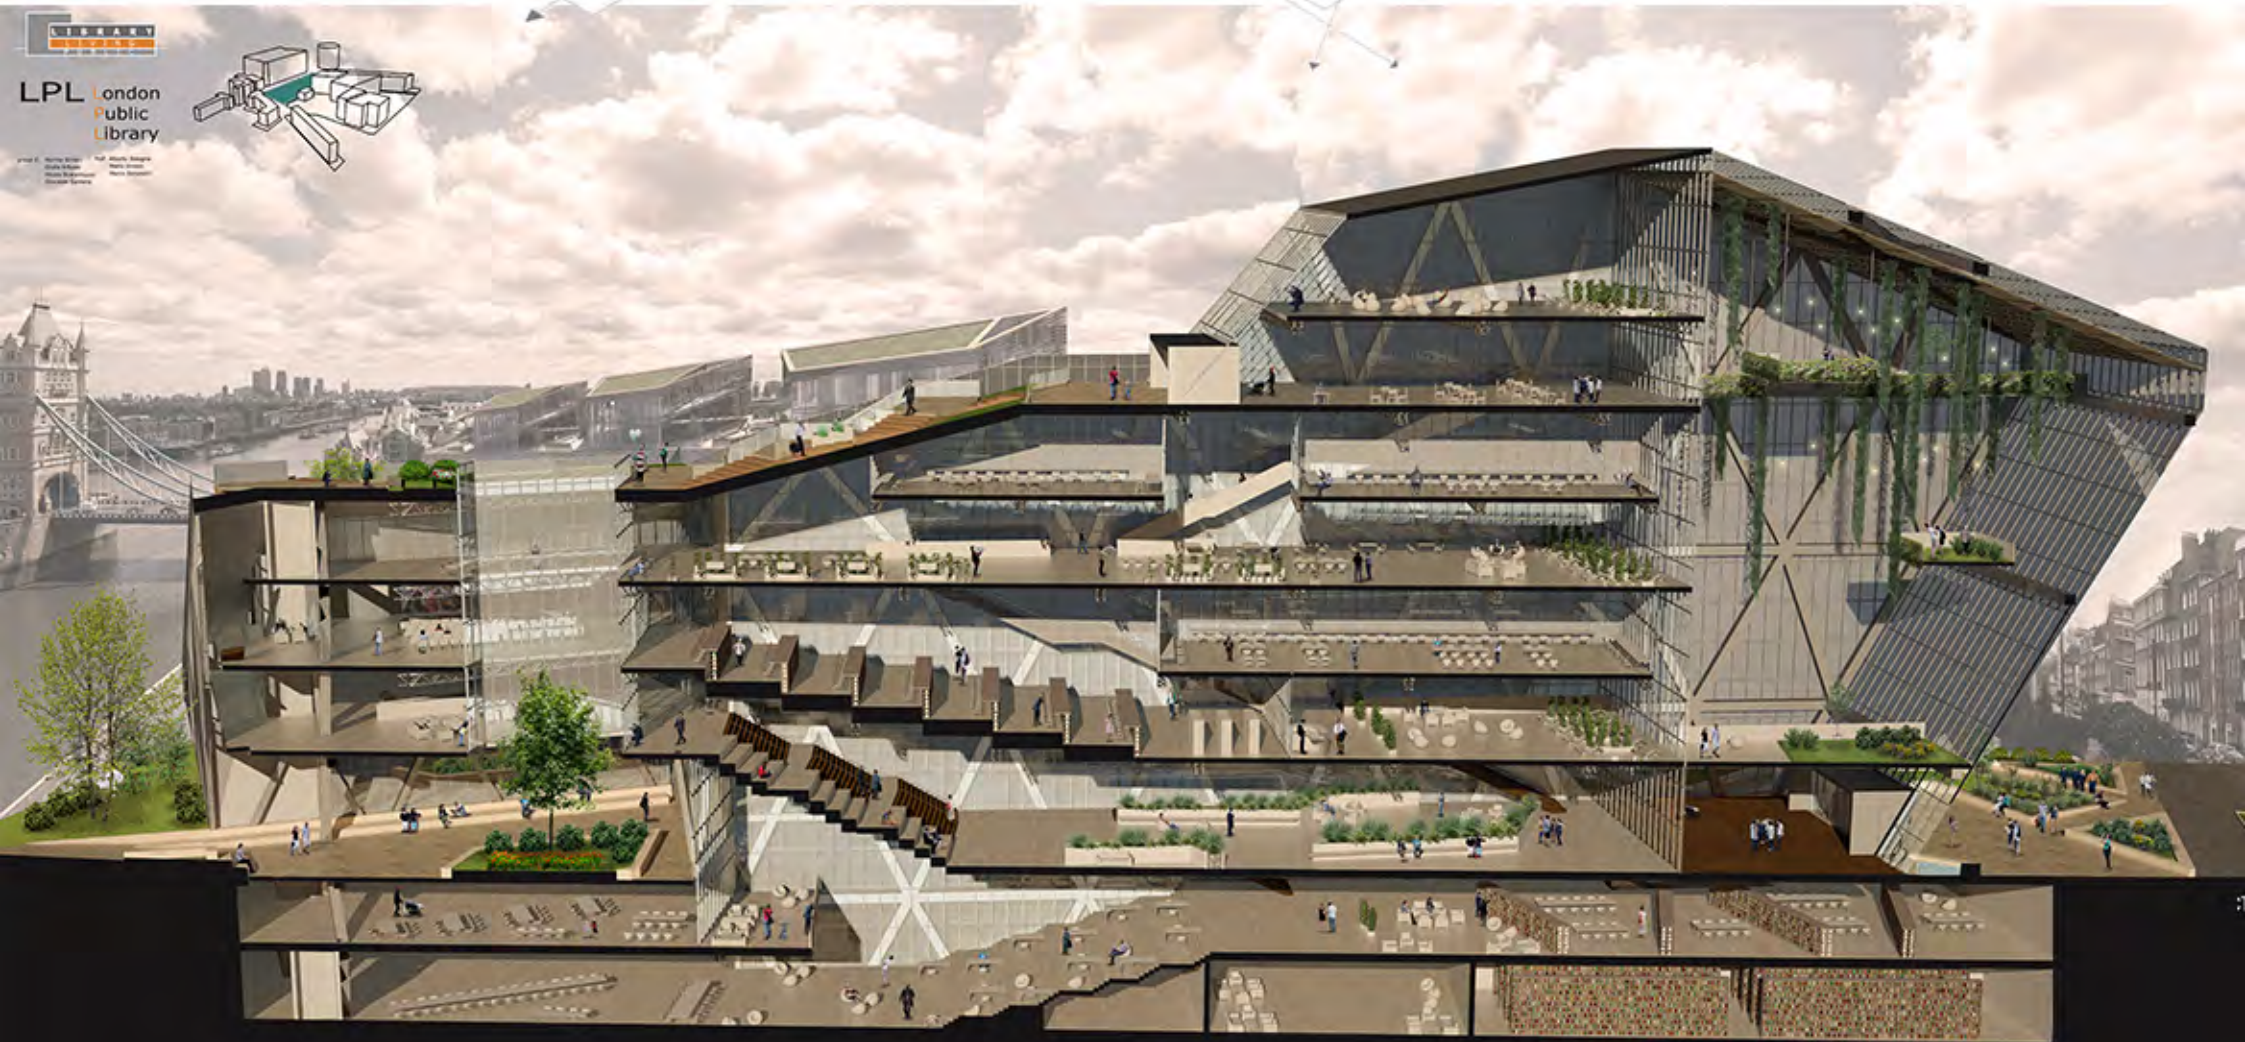

site problem & revitalization

Sustainable project to me means to combine on-site observations and environmental measurements to investigate the relationship between building, climate and occupants. Providing local solutions requires an understanding of what makes a good environment for inhabitants, indeed architecture deals with real-life problems that affect cities, doing "more with less".

COMPETITION_LPL

LONDON PUBLIC LIBRARY

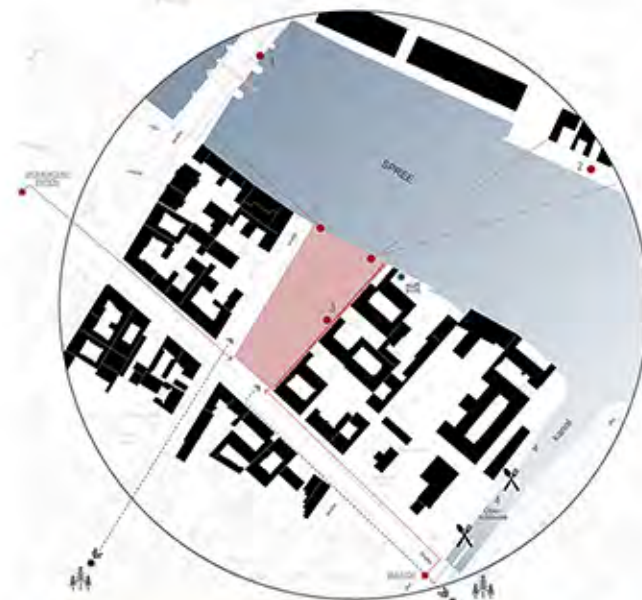

the concept

urban village

The project must live with the place and interact with the district. For this reason the building provides free access to the public in a common area: a ramp and a pedestrian path between buildings creates a bond.

bike friendly architecture

A ramp allows convenient bicycle transportation to the apartments, common spaces are sized and accessible, circulation routes are equipped with bicycle parking spaces

Model_ in practice work

in the process of a design research, a physical representation makes a significant difference.

models are usefull in exploring opportunities about the interaction of volumes, or to get an idea of how buildings look from different angles.

thank you!
