

Lego African School

In this project, we designed a modular school, taking into account the wishes and values of enko, inspired by lego games, and linking the space with students' childhood memories, in addition to achieving a system with high flexibility. It can be used in other parts of Africa to reduce construction costs as much as possible

Explode Plan

In the spatial staining of the school, we have considered two things in particular

1. Separate the spaces needed by primary school students from high school students as much as possible.
2. Placing less used spaces on higher floors.

Vertical access

Vertical access of the floors through the exposed stairs helps to increase the dynamics of the space.

Visual communication of floors

Playgrounds and corridors on different floors give us different views of different floors.

Playground

Existence of playgrounds in different floors and opening of classrooms to increase the vitality and dynamism of the space.
