

BC Building Consulting is an engineering company established in 2000 as a natural development of the professional activities of its CEO, surveyor Pasquale Miele and of the technical director, prof. eng. Maurizio Nicolella.

BC mainly works in multidisciplinary teams, to which it provides a methodological contribution based on its technical, performance-based, operational approach to design activity, encompassing all the specialized applications in a tested unified scheme that allows an efficient control of compliance.

The performance-based, technological and operative analysis is carried out with Wbs (work breakdown structure) methods that embrace within them the three branches of data (Performances, Spaces and Technologies). The operational programming is based on the Wbs of the project, which also represents the base for the integrated management of all its documents, including the technical, descriptive and performance specifications, detailed for each single task.

BC participated in the project of Milano Tower in phases D, E and F; our contribution to the project concerned the Wbs structure, technical specifications and the material sheets of the civil works. The project manager for BC was the engineer Alba De Pascale.
